ARCHITECTING NEW PRIMITIVES

// **PROTOCOL:** ERC-3643 IDENTITY GATED
// **ATOMICITY:** HASHED TIMELOCK CONTRACTS
// **RESEARCH:** S. MADUGULA, 2026

The global financial architecture is undergoing a paradigmatic shift from account-based legacy systems to token-based distributed ledger technologies (DLT). While the internet has democratized the exchange of information, the improvement of economic technologies (DLT). While the internet has democratized the exchange of information, the latency art of economic value remains constrained by pre-digital, siloed infrastructures that impede interoperability and cost. This paper presents a comprehensive proposal for a distributed ledger infrastructure specifically for the Gujarat International Financial Centre (GIFT City). Addressing the "Blockchain trilemma" of decentralisation, scalability, and security, the proposal introduces three key primitives: first, a novel identity-gated token standard (ERC-3643) that enables programmable value while maintaining strict regulatory compliance. Second, a stress-tested utility mechanism for institutional settlement, and Hashed TimeLock Contracts (HTLC) for atomic cross-chain interoperability. We conclude with a detailed analysis of the system's compliance with the IFSCA Payment Services Regulations 2024, demonstrating how programmable value can coexist with strict anti-money laundering (AML) and counter-terrorist financing (CFT) mandates.
